No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                            US-09-383-318-2

New mutant glucose isomerase enzymes -
obtd. by site-directed mutagensis of gene from Actinoplanes
missouriensis, used for produ. of high fructose corn syrups
missouriensis, spp; English.
The invention is a novel mutant glucose isomerase (GI) enzyme with
improved properties thru AA substitu. The GI is pref. derived from
Actinoplanes missouriensis. The substitu. is Lys for Arg.

These muteins are used to convert glucose to fructose, and xylose to xylulose, ed n mfr. of sweetners. Compared with native xylose the muteins have different chemical and thermal stability, kinetic constants, specificity and/or lower optimum pH. Amino acid substitution sites are selected by first determining, from the crystallographic structure, the phi and psi angles, then screening these for values within the specified ranges eg a site which has a phi backbone configuration angle -40 to 95 degrees when psi - 120 to 180 degrees, and is able to accommodate A without distortion of the 3-D protein structure, so that the substitution decreases the configurational entropy of unfolding CEU; or replacing the CEU.

                                                 Improving heat resistance of glucose isomerase - comprises replacing part of amino acid in specific position of amino acid sequence [Claim 1; Page : , 7pp; Japanese.
This represents a mutant of Streptomyces glucose isomerase that has improved heat resistance. The mutant was created by replacing an amino acid in a specific position of the mature wild-type sequence. The glucose isomerase is useful for the preparation of isomerised

obtd. by site-directed mutagensis of gene from Actinoplanes
missouriensis, used for prodn. of high fructose corn syrups
Disclosure, 56pp; English.
The invention is a novel mutant glucose isomerase (GI) enzyme
improved properties thru AA substitu. The GI is pref. derived
Actinoplanes missouriensis. The substitu. is Lys for Arg.
                                                                                                                                                                                                                                                                                                                                                                                               Length 387;
                                                                                                                                                                                                                                                     sequence is not provided in the specification; it modifying the glucose isomerase sequence provided 387 AA;

The wm untant glucose isomerase enzymes - obtd. by site-directed mutagensis of gene from Actinoplanes obtd. by site-directed mutagensis of gene from Actinoplanes of an isocuries; 56pp; English.

C The invention is a novel mutant glucose isomerase (GI) enzyme with improved properties thru AR substitn. The GI is pref. derived from Actinoplanes missocuriensis. The substitn. is Lys for Arg.

C Or vice versa. Figure 21 compares AA sequences of GI from different

obtd. by site-directed mutagensis of gene from Actinoplanes
missouriensis, used for prodn. of high fructose corn syrups
Disclosure; ; 50pp; English.
The invention is a novel mutant glucose isomerase (GI) enzyme with
improved properties thru AA substitn. The GI is pref. derived from
Actinoplanes missouriensis. The substitn. is Lys for Arg.
or vice versa. Figure 21 compares AA sequences of GI from different

- exists in chromosome of Streptomyces and is contained in recombinant etc.
Claim i, fig 1, 6pp; Japanese.
Glucose isomerase from Streptomyces spp. (see N90362). Used to study this protein's structure by recombinant techniques, and for sequence 394 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   EPKPNEPRGDILLPTIGHALAFIERLERPELYGVNPEVGHEQMAGLNFPHGIAQALWAGK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                23-AuG-1990 (first entry)
complete sequence of wildtype (WT) Actinoplanes missouriensis
glucose isomerase (GT)
Site-directed mutagenesis; glucose isomerase; Actinoplanes missouriensis;
Migh fructose corn syrup.
Actinoplanes missouriensis.
EP-331029-A.
Mutants of the xylose isomerase (XI) gene esp. Arthobacter strain B3728, have been shown to have increased thermal stability, and/or improved activity at low pH, and/or affinity for metal ions esp. Ca. Useful in industrial conversion of glucose to sweeter sugars.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 FGADAATRDGIVAGFSKALDETGLIVPMYTTNLFTHPVFKDGGFTSNDRSVRRYAIRKVL 120

ROLCOSE isomerase mutants with altered substrate specificity -
and methods for selecting aminoacid(s) for substrate specificity -
and methods for selecting aminoacid(s) for substrate specificity -
and methods for selecting aminoacid(s) for substrate specificity -
ciaim 13; Page 13; 18pp; English.

The analogue was preped by site directed mutagenesis of the GI
gene. The substrance of fo-8A of the 01, 02 and 03 positions of the
substate in the enzyme-sorbitol-cobalt complex. This causes
disruption of the water structure in the interface and displaces
construction of the water structure in the interface and displaces
construction by the substrate. This gives the enzyme a
calibhatic hydrogens of the substrate. This gives the enzyme a
charter RM(xylose)/Km(glucose) ratio compared with the wild type.

The GI is used in industrial processes, e.g. for the prodn. of

Biologically active modified protein prodn. -
comprises substituting arganine residue for lysine in starting protein
Disclosure; Fig 15: 64pp; English.
It is D-glucose isomerase from Actinoplanes missouriensis
(DSM 43046). Its DNA is genelically engineered to code for a mutein
that has increased thermostability and increased resistance
the chemical modification. Its DNA is used in an example of
the method, which is claimed, where one or more Lys are substd. by Arg o
vice versa, at a site which can accommodate such a substitution without
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       240

Glucose isomerase mutants with altered substrate specificity - and mothods for selecting aminoacid(s) for substitution, used of . in prodn. of high fructose corn syrup.

T. e.g. in prodn. of high fructose corn syrup.

T. e.g. in prodn. of night fructose corn syrup.

C. claim 13; Page 13; 18pp; English.

T. e. substitution, used a better km(xylose)/Km(glucose) ratio than the wild type.

T. d. in industrial processes, e.g. for the prodn. of See also R13278 R13287.

A; Molecule type: DNA
A; Molecule type: Ascention: A: Tay crystallography, 2.5 angstroms
C; Genetics: annotation; X-ray crystallography, 2.8 angstroms
C; Genetics: annotation; X-ray crystallography, 2.8 angstroms
C; Genetics: A; Saference number: A58417; MuID:89184498
A; Start codon: GTG
C; Complex: homotetramer
C; Function:
C; Function:
C; Function:
C; Function:
C; Function:
A; Description: catalyzes isomerization of the aldopentose to the 2-ketopentose
     the 2-ketopentose
A; Description: catalyzes isomerization of the aldopentose D-xylose to the 2-ketopentos A; Pathway: xylose metabolism
C; Superfamily: xylose isomerase isomerase isomerase; magnesium; xylose is 54,57/Active site: His, Asp #status predicted
F; 54,57/Active site: His, Asp #status predicted
F; 90,183/Binding site: substrate (Thr, Lys) #status predicted
F; 131,217,245,232/Binding site: magnesium (Glu, Glu, Asp, Asp) #status predicted
F; 217,220,255,257/Binding site: magnesium (Glu, His, Asp, Asp) #status predicted
                                                                                                                                                                                                                                                                                                        ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240

xylose somerase (EC 5.3.1.5) - Arthrobacter sp.

Xylose stomerase (EC 5.3.1.5) - Arthrobacter sp.

NiAlternate names: D-glucose isomerase
C; Species: Arthrobacter sp.
C; Species: Arthrobacter sp.
C; Species: Arthrobacter sp.
C; Species: Arthrobacter sp.
C; Date: 21 - Sha', Sl6212; S28154
R; Loviny-Anderton, T: Shaw, P.C.; Shin, M.K.; Hartley, B.S.
Bloochem. J. 277, 263-271, 1991
A; Title: D-Xylose (D-glucose) isomerase from Arthrobacter strain N.R.R.L. B3728. Gene
A; Recension: S16214
A; Molecule type: DNA
A; Residues: 1.355 < 4210.
A; Residues: 1.355 < 4210.
A; Residues: EMBL:X59466; NID:939058; PIDN:CAA42073.1; PID:939059
A; Experimental source: EMBL:X59466; NID:93728

A;Title: Xylose (glucose) isomerase gene from the thermophile Thermu A;Reference number: A39404; MUID:91216978
A;Accession: A39404
A;Molecule type: DNA
A;Residues: 1-387 < CDEK>
C;Superfamily: Xylose isomerase
C;Keywords: homotetramer; intramolecular oxidoreductase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         77;

xylose isomerase (EC 5.3.1.5) - Clostridium thermosaccharolyticum
c; Species: Clostridium thermosaccharolyticum,
C; Species: Clostridium thermosaccharolyticum,
C; Species: Clostridium thermosaccharolyticum,
C; Date: 16-Aug-1996 #sequence_revision 16-Aug-1996 #text_change 16-Jul-1999
C; Accession: 140806
R; Maeden, P.G.; Aduse-Opoku, J; Reizer, J; Reizer, A.; Lanceman, Y.A.; Martin, M.F.; M
Gane 141, 97-101, 1994
A; Title: The xylose isomerase-encoding gene (xylA) of Clostridium thermosaccharolyticum:
A; Reference number: 140806; MUID: 94215896
A; Recession: 140806
A; Status: preliminary; translated from GB/EMBL/DDBJ
A; Status: preliminary; translated from GB/EMBL/DDBJ
A; Status: cferences: GB: M91248; NID: g144787; PIDN: AAA79035.1; PID: g144788
C; Genetics:
A; Gene: xylA
C; Superfamily: xylose isomerase
C; Ksywords: intramolecular oxidoreductase; isomerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           14;

xylose isomerase (EC 5.3.1.5) - Thermoanaerobacterium thermosulfurigenes
N.Alternate names: xylose ketol-isomerase
C;Species: Thermoanaerobacterium thermosulfurigenes
C;Date: 30-Jun-1992 **sequence_revision 30-Jun-1992 **text_change 18-Jun-1999
C;Accession: A36598; Si5119
R;Lee, C.; Bagdasarian, M.; Meng, M.; Zeikus, J.G.
J. Biol. Chem. 265, 19082-19090, 1990
A;Title: Catalytic mechanism of xylose (glucose) isomerase from Clostridium thermosul A;Reference number: A36598; MUID:91033437
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A; Pathway: xylose metabolism
C; Superfamily: xylose isomerase
C; Keywords: homotetramer; intramolecular oxidoreductase; isomerase; magnesium; xylose
F; 101, 104/Active site: His, Asp #status predicted
F; 141, 234, Painding site: substrate (Thr. 1ys) #status predicted
F; 232, 268, 296, 339/Binding site: magnesium (Glu, Glu, Asp, Asp) #status predicted
F; 268, 271, 307, 309/Binding site: magnesium (Glu, His, Asp, Asp) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A; Molecule type: DNA
